

How should the platform hold people's money?

Every crypto platform has to answer one question before anything else: **who actually holds the coins?** There are three common answers. They differ mainly in how much responsibility — security and legal licensing — sits with **us** versus **someone else**. Here is each one in plain English. Please pick the direction you want and we'll build around it.

OPTION 1 · ALREADY BUILT

We hold the money

A custodial exchange — like Binance or Coinbase

People sign up, move their crypto into accounts we manage, and buy, sell, and trade inside our platform. We keep the coins safe and run everything ourselves.

THE UPSIDE

A real, self-contained exchange — our own trading, our own peer-to-peer market, our own rules. Users need nothing outside our app.

THE COST

We become legally responsible for holding other people's money. That means strong security *and* government licences (money-transmitter registration) — genuinely serious and expensive.

OPTION 2 · THE IDEA YOU RAISED

People connect their Binance account

A dashboard on top of Binance — “make an account, then link Binance”

People sign up with us, then link their existing Binance account. Their coins stay on Binance the whole time — our platform is the friendly dashboard and controls layered on top.

THE UPSIDE

Binance holds the money and handles the security and the legal side — so that heavy burden is *not ours*. Much faster and cheaper to launch.

THE COST

We're a front-end to Binance, not our own exchange. Every user must already have a Binance account, and they're limited to the countries Binance allows.

Each person holds their own wallet

Self-custody — this is what Exodus actually is

Each user gets a private wallet that only they control, protected by a secret recovery phrase. We never touch their coins at any point.

THE UPSIDE

We hold no one's money, so almost none of the licensing and security burden lands on us. The user owns everything.

THE COST

If a user loses their recovery phrase, their money is gone for good — no one can recover it. And it's a wallet, not an exchange: no shared marketplace or order book.

Side by side

	WE HOLD IT	LINK BINANCE	OWN WALLET
Who actually holds the coins	Us	Binance	The user
Who's responsible for security & licences	Us — the heavy part	Binance	Barely any — it's the user's
If a user forgets their password	We reset it; funds are safe	Binance handles their account	Funds are lost — unrecoverable
Is it a full exchange of our own?	Yes, entirely ours	No — a dashboard on Binance	No — it's a wallet
Effort & cost for us	High	Low	Low-medium

WHAT WE NEED FROM YOU

Which model do you want?

The quick way to decide: Options 2 and 3 hand the hard, risky part — holding funds and the legal licensing — to someone else, so they're lighter and cheaper to launch. Option 1 is the most powerful and independent, but it's the one that carries real legal and security weight.

- **Want our own independent exchange**, and ready for the licensing & security work? Option 1 (*already built*).
- **Want to launch fast and keep money-handling off our plate?** Option 2 — the “account, then link Binance” idea.
- **Want users to fully own their crypto**, wallet-style? Option 3.

Just tell us which one and we'll shape the rest of the build around it.
